BENTONITE CLAY - GRANULES

Product Code: 6081

Bentonite granules provide an effective solution to prevent lateral water seepage through natural, and man made bunds and dams. Low permeability vertical barriers can be achieved by cutting a slit trench and simply pouring the granules into the excavation. (or, "sandwich" the granules between geosynthetic (weed) membrane to provide a highly effective clay barrier) Moisture in the ground will cause the granules to swell and form a seal. A vertical trench filled with bentonite can also be particularly effective to constrain root growth around newly planted trees, the bentonite barrier preventing damage to foundations and service ducts.
